This is the 5' sequence of the clone insert
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKFZ): Email s.wiemann@dkfz- heidelberg.de;
sequenced by AGOWA (BerlinfGermany) within the cDNA sequencing
consortium of the German Genome Project.
No sl sequence available.
This clone (DKFZ)686B092) is available at the RZPD in Berlin.

This is the 5' sequence of the clone insert
Clone from S. Wiemann, Molecular Genome hallysis, German Cancer
Kesearch Center (DKFZ); Email s. Wiemann@dkfz- heidelberg, de;
sequenced by Qiagen (Hilden/Germany) within the cDNA sequencing
consortium of the German Genome Project.
This clone (DKFZp686F01165) is available at the RZPD in Berlin.

This is the 5' sequence of the clone insert
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKFZ); Email s.wiemann@dkfz-heidelberg.de;
sequenced by Qiagen (Hilden/Germany) within the cDNA sequencing
consortium of the German Genome Project.
This clone (DKFZp68601016) is available at the RZPD in Berlin.
Please contact the RZPD Ressourcenzentrum, Heubnerweg 6, 14059

This is the 5' sequence of the clone insert
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKZP); Email s.wiemann@dkfz-heidelberg.de;
sequenced by Qiagen (Hilden/Germany) within the cDNA sequencing
consortium of the German Genome Project.
This clone (DKZp666H08165) is available at the RZPD in Berlin.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
throughput detection of differential expression of one or more throughput detection of differential expression of one or more polymucleotides in a sample. The sample is from a subject with a therosclerosis and comparison with a standard defines early, mid or late stages of the disorder. The foam cell-expressed mucleic acids are useful for thigh throughput screening of a library of molecules or compounds to identify a ligand which binds a polymucleotide. The library is chosen from DNA molecules, proteins and RNA molecules or compounds to identify at least one ligand which specifically binds a protein, for purifying a ligand from a sample for making a antibody. The compounds to identify at least one ligand which specifically binds a protein, for purifying a ligand from a sample for making a antibody. The cardiovascular disorder. The foam cell-expressed nucleic acids are useful as elements on a microarray which can be used for detecting related at the present sequence represents a cDNA whose expression is therosclerosis. The present sequence represents a cDNA whose expression is supregulated in LPS treated foam cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patch of form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                        The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used from redicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format directly from WIPO at ftp.wipo.int/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               437
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ATGTAAATCAGTGGTTAGAAAGTCATAAGATTGACCAAAAACACAGGGAAATTTTGACTG 197

                                                                                                                                                                                                                                                                                                                                                                                     for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, messuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal dispnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GCATCACACATGGACCAGCTATTCAAATAGAACAACTATTCAAAGAATTGCGGAAAACAG

The method involves contecting the probes with a collection of detectably labelled nucleic acids derived from expression of the probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or proposing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring this invention presents a far greater diversity of probes for measuring microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present estate for this parted did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the electronic format directly from WIPO at the wipp.int/pub/published_pot_sequences

exon nucleic acid probes for analyzing gene expression in human Single hearts.

絽 Rank

Chen W,

Penn SG, Hanzel DK,

(MOLE-) MOLECULAR DYNAMICS INC

NO 14637; 530pp; English SEQ ID Claim 4;

4719 4659 4599 4539 4479 4419 4418 AGAACCCAGATATGGCTAATCCGTCTGCAATGAGTACAACTGCTAAAGGTTCTAAGTCAC 4359 4299 4239 4179 4119 4059 3999 3939 The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in alectronic form at directly from WIPO at ftp.wipo.int/pub/published_pot_sequences 257 317 437 497 557 617 677 737 797 857 4778 GTATCAGAATGGCAAAGCAACTTAACCTTCCAGAAATACAGATGATTGGACAAAAGAGG 3998 AAGCCCTCATTAACCATTTCAATCTGATAAACAAGTATTTTGAAGACCATCAAGTCC 4718 AIGTAAAICAGIGGITAGAAAGICATAAGATIGACCAAAAACACAGGAAATITIGACTG 678 AAGCCTTCACAAATACAGCAACAGCACAGAAGAGAGGATGTCAAGATGAAATTTAGCAATG 738 AGGTTTTCCGATTTGCTTCAGCTTGTATGAATTCACGTACCAATGGCACTATTCATTTTG GAGTCAAAGACAAACCCCATGGGAAAATTGTTGGCATCAAAGTCACCAATGATACCAAGG AAGCCCTCATTAACCATTTCAATCTGATGATAAACAAGTATTTTGAAGACCATCAAGTCC GTATCAGAATGGCAAGCAACTTAAACCTTCCAGAAAATACAGATGATTGGACAAAAGAGG 138 ATGTAAATCAGTGGTTAGAAAGTCATAAGATTGACCAAAAACACAGGGAAATTTTGACTG aacaagacgtgaatggagtcttgaagtggttaaaaaagaacatcttgttgatatgg GCATCACACATGGACCAGCTATTCAAATAGAAGAACTATTCAAAGAATTGCGGAAAAGA CCATTGAAGATTCGATTCAGACATCTAAGATGGGAAAGCCCCAGTAAAAATGCTCCTAAAG #538 CCATIGAAGATICGATICAGACATCTAAGATGGGAAAGCCCCAGTAAAAATGCTCCTAAAG accaaactgtgtctcaaaaggaacgtagagaaacttcaaagcaaaaacaaaagggtaaag ACCTGACATGTGTATCATATCCATTTCATGAATTCAGTAATCCATATCGTTACAAGTTGG 618 ATTITAGICTACAGCCIGAAACAGGACCAGGCAATCTCATIGATCCGATACATGAATTCA AGAACCCAGATATGGCTAATCCGTCTGCAATGAGTACAACTGCTAAAAGGTTCTAAGTCAC Gapa ery Match 94.9%; Score 1470.4; DB 4; Length 4778; st Local Similarity 99.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               4359
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4239
                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                        The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    197
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            377

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the invention
                                                                                                                                                                                                                                                                human

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver. Comprising one of 13109 defined nucleotide sequences given in the specification for complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABS25011-ABS51005 represent human liver single exon nucleic acid probes of the invention. Note: The sequence information for this patent does not appear in the printed precification but was obtained in electronic format directly from WIPO at

The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases include: breast, chibrocyttic changes, proliferative breast disease and noncarcinoma tumours. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      197
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    to measuring gene expression in

C complements or the 12387 open reading Izames derived from the 12014 probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung; measuring gene expression in a sample carle expression of detectably labeled mucleic acids derived from human lung measuring the label detectably bound to each probe of the carray; identifying exons in a enkaryotic genome, comprising (a) array; identifying exons in a enkaryotic genome, comprising (a) the extray; identifying at last one exon from genomic sequences of the enkaryote; and (b) detecting specific hybridisation of detectably bound to labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, that identifying at last one exon from genomic sequence of in the above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method a bove and (b) measuring the expression of each of the exons in several customers and/or cell types using hybridisation to a single gene, a peptide comprising one of the exons should be assigned to a single gene; a peptide comprising one of the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human clustom explains and for identifying exons in a gene, particularly using human clustomers, chronic obstructive pulmonary disease such as asthma. Lung derived mRNA and for the stude (CCPP), interstitial lung disease (ILD), familial idiopathic pulmonary fibrosis, pulmonary soliarry compared syndrome, sarcoidosis, pulmonary disease (OCPP), interstitial lung disease (ILD), familial idiopathic pulmonary disease (OCPP), interstitial lung cancer, chronic obstructive pulmonary disease, viewment sequence is a single exon probe poper.

C pudlak syndrome, sarcoidosis, pulmonary dispate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as Alzheimer's Parkinson's disease, fluntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic assets for receptor activity, arthritis and inflammation, leukaemas and chrombolytic activity, arthritis and inflammation, leukaemas and C.N.S disorders.                                                                                                                                                                                                                   The invention relates to a polynucleotide comprising a sequence given in the specification, or its mature protein-coding portion, or its complement. The polynucleotide is useful for treating diseases e.g., cancer or neurodegenerative diseases and many others listed in the specification. The present sequence represents a novel human cDNA. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at segdata.uspto.gov/sequence.html?DocID=20030104529.
                                                                                                                                                                                                                                                                                                                                                               1381 GCAAACCTTCCAACTGTATATGTAGAACAAAAAACCACACAACGAATT
